Vertiscreen - The Perfect Sunprotection Solution...

Vertiscreen at home on this elegant property.

Vertiscreen at work on a commercial building.

Vertiscreen cleverly incorporated into a new bay window.

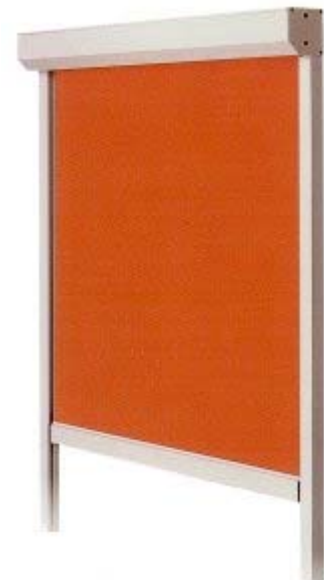

Vertiscreen is an exterior vertical blind sunprotection system from Europe, with a modern slim-line look.

Easily and discretely fitted to an existing home or commercial building, **Vertiscreen** can also be installed inside a reveal during construction, thus totally hiding the components from view.

Its compact profile includes a neat 95mm x 95mm aluminum head box, square bottom rail and side channels, which can be powdercoated to any colour required. An important contributor to **Vertiscreen's** energy efficient design is the narrow gap between glass and fabric, similar in principle to a roller shutter.

Depending on the fabric chosen, some of the benefits achieved with **Vertiscreen** will be improved insulation from heat gain and loss, UV shielding and reduction of glare. An opaque fabric can be used to create total blackout, while a sheer fabric can offer sunprotection, without losing your view.

Options for **Vertiscreen** are manual operation with a gearbox or fully automatic operation using our Tubular Drive Motors. Motorisation further allows group control over a number of windows simultaneously, timer function and climate sensor.
